SopoTech, Inc. has been completed development of the product that will use 60GHz radar sensor and we are planning to sell the product in the United States.

While development was ongoing our sales/marketing team found that FCC is considering adopting rules that will allow for the product that requires radar operation and we are very interested in that: we have developed "touchless switch" which is totally beneficial to reduce COVID infection. However, if the updated rules are not well aligned with European rules it would mean a delay, increased cost for redesign, or decision to not offer product in US.

SopoTech, Inc. supports the proposals for new rules that were made by Acconeer in its comments filed in the proceeding (ET Docket No. 21-264).

We believe it is important that FCC promotes improvement of new radar technologies through adoption of flexible and neutral rule which is consistent with ETSI standards and we also believe it will allow device makers certainty in innovation of developing new product in a cost-effective manner.

In our perspective using pulse radar technology need to be treated in equal way in comparison with other all types of radar system is very important to us. Otherwise it will be burden to us in consideration of the impact of proposed technical rules on specific operations.

Please make sure that commission should not provide a competitive advantage to some parties by adopting rules that have varying consequences on different radar technologies.

Sincerely Yours

Donghui Shin
CEO
